VISUALISATION SUITE

Existing Data → Extraction and Labelling → Analytics Dashboard

Data Visualisation is **never simple**. Behind the layers of information presented in a dashboard, lies the problem of rapid data loading, flexible visualisation, customisable dashboarding, and most importantly, attractive presentation.

SYGNOS PIPELINE:

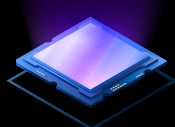

Database

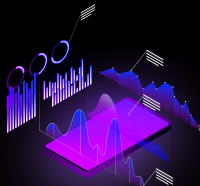

Data Loader

Extraction

SygnosDB

Dashboard

With these problems in mind, we developed Sygnos Visualisation Suite to enable rapid development and deployment for any sorts of visualisations required in a dashboard.

Unlike other solutions available on the market, **Sygnos Visualisation Suite** is comprised of a database system and a rapid dashboarding toolkit. This was designed to ensure maximum data availability for the dashboard, and streamlining the whole process of collecting, integrating, managing, and visualising the data.

Our database, **SygnosDB**, is designed for rapid data ingestion and processing. With the rapid capacity to ingest, process, and deliver data, it would allow for fast and streamlined data management for the dashboard, minimising the risks of error caused by data inconsistencies and information lags.

Our visualisation suite, built on top of the database, is designed for rapid design, prototyping, and deployment. Sacrificing flexibility for customisability, it was made to be a dashboard system that stays consistent and persists over time, providing a single source of information to every stakeholders. It is also designed to be lightweight while remaining highly customisable.

Included with the suite is our visualisation and design capacity, which would enable our clients to have their own unique customised dashboard, crafted lovingly by our team of data analysts which would work with our clients to ensure that the quality of information presented in the dashboard, and the quality of the presentation itself.
